Member Report for Ashton Curry in Prickly Port Pirates

I have contributed to the project by creating the implementation and solution architecture portion of our project to the paper. Additionally, I helped format and edit various parts of the research paper. I have also done research into blockchain and added three sources to our paper. I also workshopped the idea for our implementation of the blockchain project with both group members, and with the professor. Our goal currently is to create two networks that are linked by a public ethereum blockchain that uses a chat system to send messages that will act as our transactions between networks. I did research on this implementation and found this could be a doable solution with the time we have in the semester. Additionally, I started the presentation slides for our group and added some information to the sections of implementation and solution architecture on the slide deck.
